What is DesignSafe?

- A web-based research platform that enables transformative research to protect human life and reduce damage during natural hazard events

DesignSafe Vision

- A cyberinfrastructure (CI) that is an integral part of research discovery
 - Provide a platform for data sharing/publishing
 - Enable research workflows and access to high performance computing (HPC)
 - Deliver cloud-based tools that support the analysis, visualization, and integration of diverse data types
- Amplify and link the capabilities of natural hazards researchers in the US and abroad

- Data Depot
- Workspace
- Recon Portal
- SimCenter Research Tools
- User Guides
- Impact of Data Reuse

2020 Hurricane Season: NSF-Funded Natural Hazards Experts Available for Comment
 For the 2020 hurricane season, experts from the NSF-supported Natural Hazards Engineering Research Infrastructure (NHERI) are available to discuss a variety of hurricane-related topics. NHERI researchers are authorities in infrastructure damage from wind and storm surge, damage mitigation efforts, societal impacts in hurricane-prone regions and post-event data collection.

SLIDE BY JOY PAUSCHKE, NSF, DEC 6 PUBLISH YOUR DATA EVENT

Your NSF Project Data Matters: Publish on NHERI DesignSafe!

DesignSafe – Your Community’s Resource!

- Your project is an investment by NSF to advance knowledge for the natural hazards engineering field
- Your proposal (award) includes a **Data Management Plan** for sharing and archiving your project data (**DesignSafe for natural hazards**)
- NSF award should include costs for processing, curating, and publishing project data
- Benefits of your published data on DesignSafe
 - Discovery of your data for future research by others, e.g., machine learning, design of new experiments or simulations
 - Citation format for others to properly reference your data

Don't Wait to Publish Your Data!

- Start early and often during NSF project
- Use DesignSafe tutorials, office hours,...
- Publish data soon after experiments/simulations completed and students available
- Publish data before NSF Final Report and Project Outcomes Report submitted/due (compliance with Data Management Plan)

DesignSafe Data Models

DATA

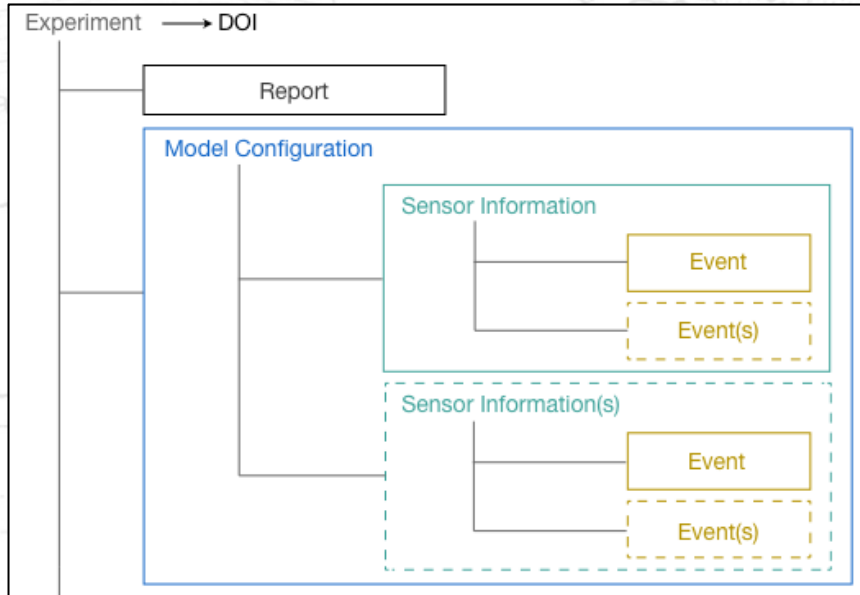

Structured, yet *flexible*, data models for different types of research

-  **Experimental Project**
For physical work, typically done at an experimental facility or in the field.
-  **Simulation Project**
For numerical and/or analytical work, done with software.
-  **Hybrid Simulation Project**
For work using both physical and numerical components.
-  **Field Research Project**
For work done by observation in areas affected by a natural hazard.
-  **Other Project**
For work other than the project types above.

Organizing Data

Experimental Data Model

Model Configuration: Files describing the design and layout of what is being tested (some call this a specimen).

Sensor Information: Files about the sensor instrumentation used in a model configuration to conduct one or more event.

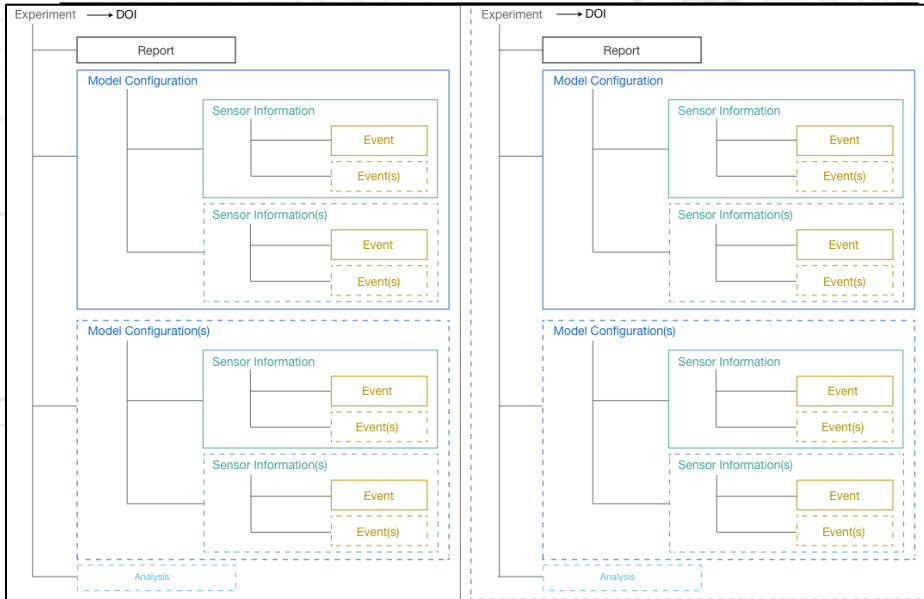

Event: Files from unique occurrences during which data are generated.

Analysis: Tables, graphs, visualizations, Jupyter Notebooks or other representations of the results.

Report: Written accounts made to convey information about the entire project or experiment.

This collection archives instruments related to the food retail survey conducted by the Hazard Reduction Recovery Center, as part of a National Science Foundation-funded project. The instrument was designed to gather specific types of information on food retailers affected by Hurricane Harvey. The survey instrument was designed to collect information on: (1) Physical and infrastructure damage, (2) Accessibility problems, (3) Impact on employees and customers, (4) Business interruption, (5) Impact on fresh food availability, and (6) Business characteristics. The survey was designed to be answered by an employee with knowledge about store operations and food availability before and after Hurricane Harvey. The survey was designed to be conducted in-person. This archive documents two versions of the survey. The first version was for use in Jefferson and Orange County, Texas. The second version was for use in Harris County, Texas.

PRJ-1811: NHERI UCSD Hybrid Simulation Commissioning

[Download Dataset](#)

PI	Mosqueda, Gilberto	View Team Members	DOI	doi:10.17603/DS25M42	Citation
Date of Publication	Dec/6/2018		Award	NSF 1520904	
Project Type	Hybrid_simulation		Keywords	hybrid simulation, shake table substructure, seismic isolation	

Description

The use of large shake tables can provide extended capabilities to conduct large- and full-scale tests examining the seismic behavior of structural systems that cannot be readily obtained from reduced scale testing, or under pseudo-dynamic conditions. When considering large or complex structural systems, however, additional challenges arise such as high costs of full scale specimens or capacity limitations of currently available shake table. Some of these limitations can be overcome by real-time hybrid shake-table substructure test method that requires only key parts to be evaluated experimentally on the shake table while the remainder of the structure is modeled numerically. As a demonstration of the applicability of this method using a large shake tables, a series of hybrid shake table tests were conducted on the UCSD Large High Performance Outdoor Shake Table (LHPOST) with capabilities to test full scale structural models. A physical specimen was built on the LHPOST, and coupled with a numerical model using hybrid simulation techniques. Comparison of different methods to interface the numerical model with the control systems were evaluated. The physical specimen consisted on a rigid mass resting on four triple friction pendulum bearings that represented the upper story of a shear building model having the effect of a tune mass damper. Numerical models of shear buildings with different periods and multiple degree of freedom were considered to evaluate the performance of the table and stability and accuracy of the simulation results. The test results demonstrate the effectiveness of tune mass dampers in reducing structural response and the benefit of using a hybrid shake table test method towards expanded system level dynamic testing. The performance of the shake table is evaluated and methods to compensate delay and other sources of error are discussed.

Five story building with tuned mass damper

Description

Shake table tests of 5DOF building model with experimental tuned mass damper using UC San Diego shake table (LHPOST). The 5-DOF model was ran using OpenSees/OpenFresco for the numerical substructure with Simulink for compensation.
